QUIZ #2 for Section 2

This is a 30-minute quiz

Student ID:	Student Full Name:

Write a pandas program that creates a DataFrame named scores from the following data: student names `['Ali', 'Buse', 'Cem', 'Deniz', 'Elif', 'Fatih']` as the index, and three columns – `'Math': [85, 42, 91, 67, 55, 78], 'Science': [70, 88, 60, 95, 40, 83], and 'English': [90, 76, 50, 88, 72, 61]`. Using `loc`, select the Math and Science scores of **'Buse'** through **'Elif'**; then use `iloc` to select the last three rows and the first two columns. Create a **boolean** mask to identify students whose Math score exceeds 70 and whose **English** score is at most 80, print their rows, and use `df.loc` to set the Science score of any student with a Math score **below 50** to 0. Drop the row for **'Cem'** and the column **'English'** permanently from the DataFrame using the ***appropriate axis argument***, then **reindex** the remaining rows to `['Ali', 'Buse', 'Deniz', 'Elif', 'Fatih', 'Gorkem']`, filling any newly introduced missing values with 0. Print the final DataFrame and verify with `df.isnull().sum()` that no missing values remain.
