

QUIZ #1

This is a 20-minute quiz

Write a NumPy program that generates a 6×6 array of random integers in the range [10, 99]. Using only NumPy-based operations, compute the mean of each row and replace with 0 all elements that are greater than the mean of their corresponding row. Then extract the odd-valued elements in the third column, determine the index of the row with the maximum row sum, and finally produce a new array in which each row is sorted independently in ascending order.
