

**QUIZ #1**

This is a 20-minute quiz

Write a NumPy program that generates a  $6 \times 6$  array of random integers in the range [20, 120]. Using only NumPy-based operations, compute the median of each column and replace with -1 all elements that are smaller than the median of their corresponding column. Then extract the elements at positions where both indices are even, compute the range of each column, and normalize the full array column-wise using min-max normalization.
